

Abstract

In an information communication system and method, firstly, when individual identification information of a user originated from a portable terminal is received with communicating means, the individual identification information is stored and managed in connection with the communicating means, and the user is accessed via the accessible communicating means on the basis of the individual identification information designated by outside. Secondly, the position of the user and accessible equipment to the user are managed on the basis of the individual identification information of each user originated from the terminal and thereby, the user is provided with the predetermined information on the basis of the management information.
